Vehicle registration plates of Taiwan

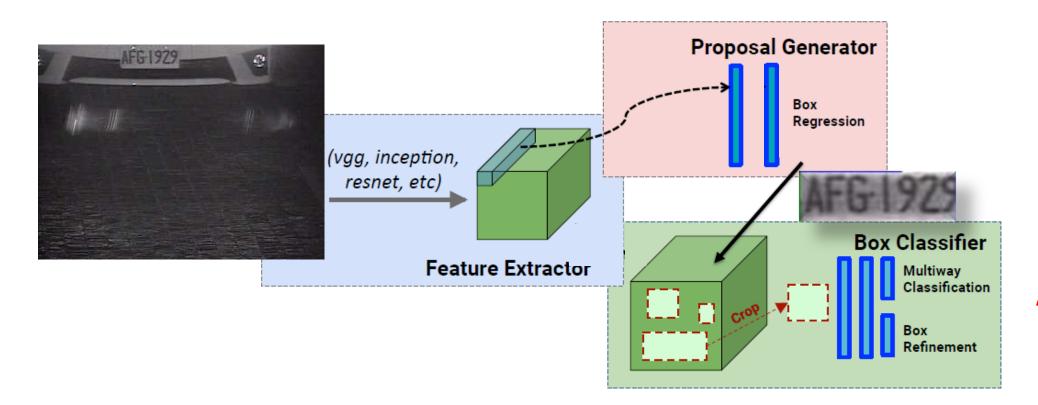

https://en.wikipedia.org/wiki/Vehicle_registration_plates_of_Taiwan

Two-Stage Approach

- Stage 1 Object Localization
 - One Feature Extractor + One Proposal Generator
 - Loss function 1 = regression error

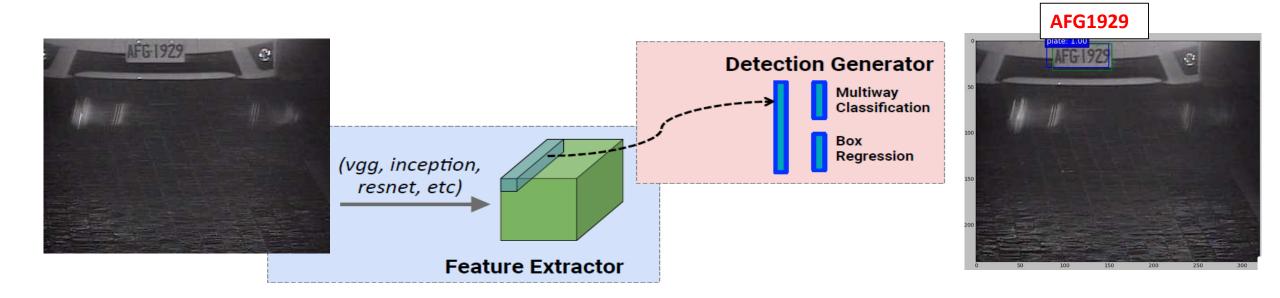

- Stage 2 Object Classification
 - Another Feature Extractor + One "cropped Image" Classifier
 - One-Hot plate number encoding
 - Loss function 2 = classification error

AFG1929

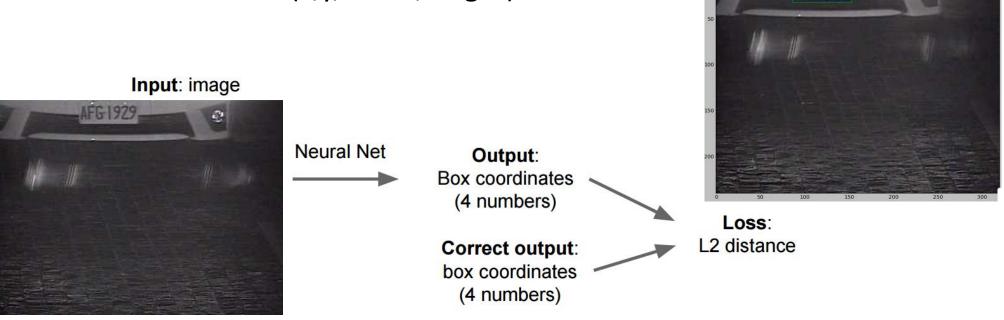

One-Stage Approach

- One Feature Extractor
- Two Output Heads
- Loss function = classification error + regression error

Output Head 1 – Localization Proposal

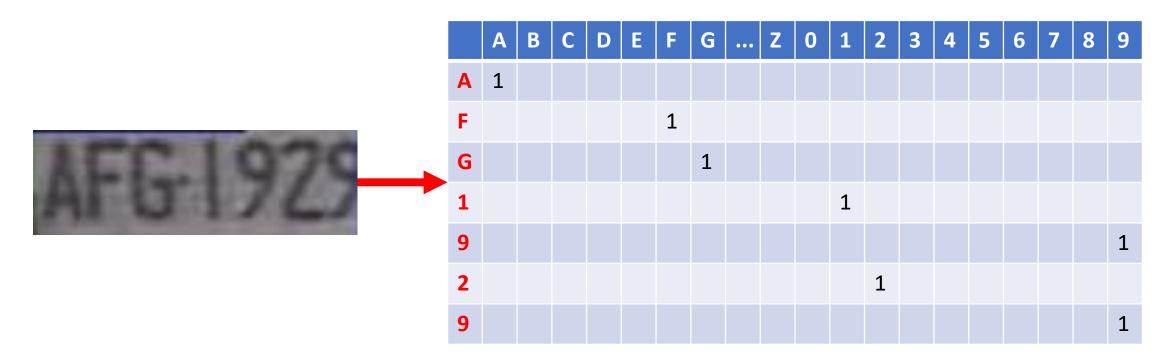

- Box Regression
 - Similar to the house price prediction task
 - But now has four values (x,y,width,height)

AFG1929

Output Head 2 – Number Classification

One-Hot encoding

Fixed String Length → multiple DNN outputs

One-Hot encoding

Total # of DNN outputs =

(None, 19200)

(None, 65)

input:

output:

c1: Dense

of Types * # of digits or

 # of Types + # of digits * maximum string length

(None, 19200)

(None, 65)

input:

output:

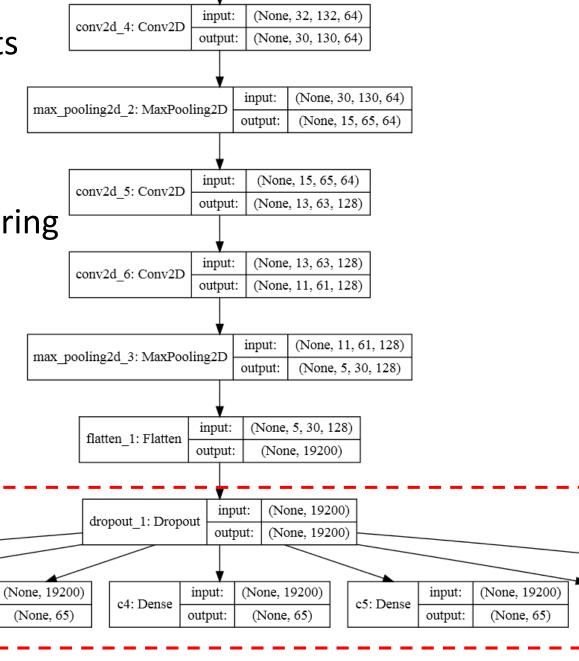

c2: Dense

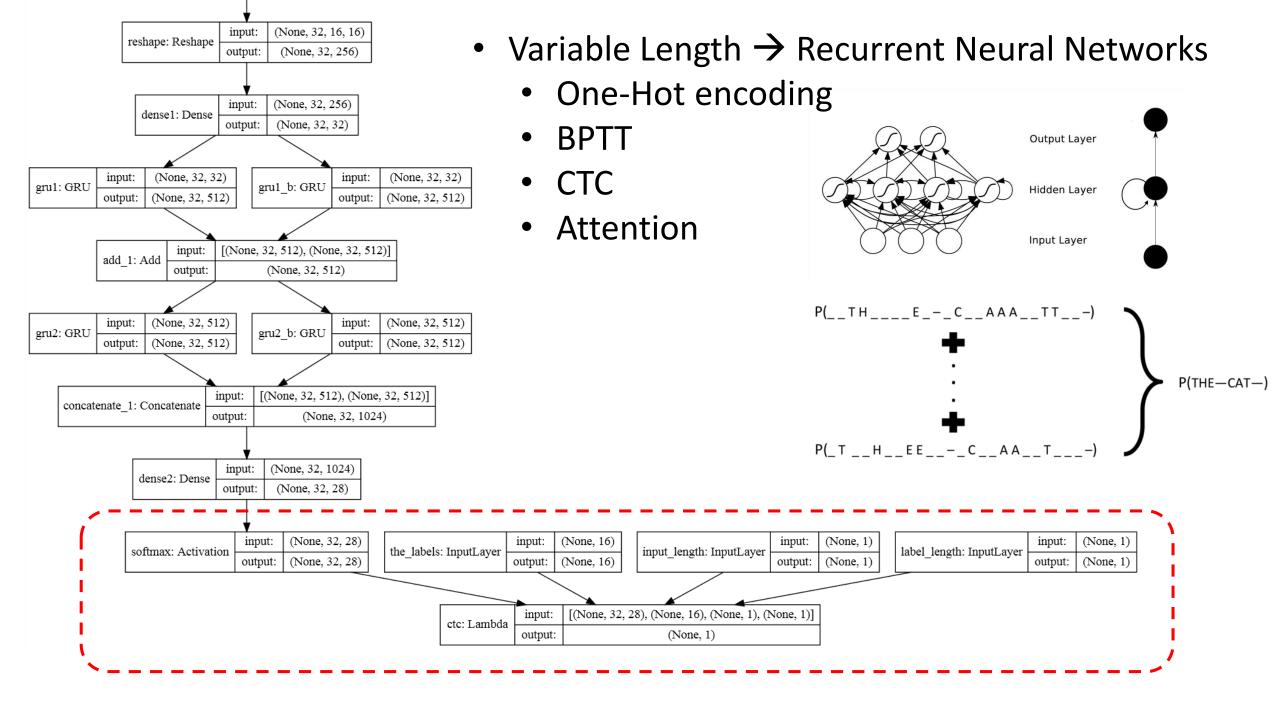

input:

output:

c3: Dense

One DNN output for each digit
